

Notice for TAIYO YUDEN products

Please read this notice before using the TAIYO YUDEN products.

REMINDERS

- Product information in this catalog is as of October 2015. All of the contents specified herein are subject to change without notice due to technical improvements, etc. Therefore, please check for the latest information carefully before practical application or usage of the Products.

Please note that TAIYO YUDEN CO., LTD. shall not be responsible for any defects in products or equipment incorporating such products, which are caused under the conditions other than those specified in this catalog or individual specification.

- Please contact TAIYO YUDEN CO., LTD. for further details of product specifications as the individual specification is available.

- Please conduct validation and verification of products in actual condition of mounting and operating environment before commercial shipment of the equipment.

- All electronic components or functional modules listed in this catalog are developed, designed and intended for use in general electronics equipment.(for AV, office automation, household, office supply, information service, telecommunications, (such as mobile phone or PC) etc.). Before incorporating the components or devices into any equipment in the field such as transportation,(automotive control, train control, ship control), transportation signal, disaster prevention, medical, public information network (telephone exchange, base station) etc. which may have direct influence to harm or injure a human body, please contact TAIYO YUDEN CO., LTD. for more detail in advance.

Do not incorporate the products into any equipment in fields such as aerospace, aviation, nuclear control, submarine system, military, etc. where higher safety and reliability are especially required.

In addition, even electronic components or functional modules that are used for the general electronic equipment, if the equipment or the electric circuit require high safety or reliability function or performances, a sufficient reliability evaluation check for safety shall be performed before commercial shipment and moreover, due consideration to install a protective circuit is strongly recommended at customer's design stage.

- The contents of this catalog are applicable to the products which are purchased from our sales offices or distributors (so called "TAIYO YUDEN' s official sales channel").

It is only applicable to the products purchased from any of TAIYO YUDEN' s official sales channel.

- Please note that TAIYO YUDEN CO., LTD. shall have no responsibility for any controversies or disputes that may occur in connection with a third party's intellectual property rights and other related rights arising from your usage of products in this catalog. TAIYO YUDEN CO., LTD. grants no license for such rights.

- Caution for export

Certain items in this catalog may require specific procedures for export according to "Foreign Exchange and Foreign Trade Control Law" of Japan, "U.S. Export Administration Regulations", and other applicable regulations. Should you have any question or inquiry on this matter, please contact our sales staff.

MULTILAYER CHIP INDUCTORS(CK SERIES / CK SERIES S TYPE)

Unit : mm (inch)

Type	Thickness mm (inch)	Chip cavity		Insertion Pitch	Tape Thickness	
		A	B	F	K	T
HKQ0402 (01005)	0.2 (0.008)	0.23	0.43	1.0±0.02	0.5max.	0.25max.

The diagram shows a horizontal tape with four main sections labeled at the top: "Blank portion", "Chip cavity", "Blank portion", and "Leader". The tape has a wavy line representing its edge. Below the tape, three horizontal dimension lines indicate lengths: the first "Blank portion" is labeled "160mm or more (6.3inches or more)"; the "Chip cavity" section is labeled "100mm or more (3.94inches or more)"; and the combined length of the second "Blank portion" and the "Leader" is labeled "400mm or more (15.7inches or more)". An arrow at the bottom points to the right, labeled "Direction of tape feed".

	t	W
4mm width tape	1.5max.	5 ± 1.0
8mm width tape	2.5max.	10 ± 1.5

A schematic diagram showing a top tape and a base tape. The top tape is being pulled to the right, as indicated by an arrow labeled "Pull direction". The angle between the top tape and the base tape is labeled $0 \sim 15^\circ$.

	MCKK2012	Idc1 : 2000mA DC, Idc2 : 1400mA DC

Definition of rated current:

- In the CK, CKS and BK Series, the rated current is the value of current at which the temperature of the element is increased within 20°C.
- In the BK Series P type, CK Series P type, NM Series, the rated current is the value of current at which the temperature of the element is increased within 40°C.
- In the LK, HK, HKQ0603, and AQ Series, the rated current is either the DC value at which the initial L value is decreased within 5% with the application of DC bias, or the value of current at which the temperature of the element is increased within 20°C.
- In the HKQ0402(~9N1), the rated current is either the DC value at which the initial L value is decreased within 5% with the application of DC bias, or the value of current at which the temperature of the element is increased within 20°C.
- In the HKQ0402(10N~), the rated current is either the DC value at which the initial L value is decreased within 5% with the application of DC bias, or the value of current at which the temperature of the element is increased within 25°C.
- In the MC Series, Idc1 is the DC value at which the initial L value is decreased within 30% and Idc2 is the DC value at which the temperature of element is increased within 40°C by the application of DC bias. (at 20°C)

	Test Methods and Remarks	BK, BKH, BKP Series, MCF Series: Temperature : 125±3°C (BK, BKH Series) : 85±3°C (BKP, MCF Series) Applied current : Rated current Duration : 500+24/—0 hrs Recovery : 2 to 3 hrs of recovery under the standard condition after the removal from test chamber. (See Note 1)		
LK, CK, CKS, CKP, NM, HK, HKQ, AQ, MC Series: Temperature : 85±2°C (LK, CK, CKS, CKP, NM, MC Series) : 85±2°C (HK1608, 2125) : 85±2°C (HK1005, AQ105 operating temperature range—55~+85°C) : 125±2°C (HKQ0402, HK0603, HK1005, HKQ0603S, HKQ0603U, HKQ0603W, HKQ0603C, AQ105 operating temperature range—55~+125°C) Applied current : Rated current Duration : 500±12 hrs Recovery : 2 to 3 hrs of recovery under the standard condition after the test. (See Note 1)				
Note on standard condition: "standard condition" referred to herein is defined as follows: 5 to 35°C of temperature, 45 to 85% relative humidity, and 86 to 106kPa of air pressure. When there are questions concerning measurement results: In order to provide correlation data, the test shall be conducted under condition of 20±2°C of temperature, 60 to 70% relative humidity, and 86 to 106kPa of air pressure. Unless otherwise specified, all the tests are conducted under the "standard condition." (Note 1) Measurement shall be made after 48+2 hrs of recovery under the standard condition				

Precautions on the use of Multilayer chip inductors

Multilayer chip inductors for high frequency, Multilayer chip bead inductors

Multilayer common mode choke coils(MC series F type)

Metal Multilayer Chip Power Inductors (MCOIL™ MC series)

PRECAUTIONS

1. Circuit Design																																																																																																											
Precautions	<p>◆Verification of operating environment, electrical rating and performance</p> <p>1. A malfunction in medical equipment, spacecraft, nuclear reactors, etc. may cause serious harm to human life or have severe social ramifications.</p> <p>As such, any inductors to be used in such equipment may require higher safety and/or reliability considerations and should be clearly differentiated from components used in general purpose applications.</p> <p>◆Operating Current (Verification of Rated current)</p> <p>1. The operating current for inductors must always be lower than their rated values.</p> <p>2. Do not apply current in excess of the rated value because the inductance may be reduced due to the magnetic saturation effect.</p>																																																																																																										
2. PCB Design																																																																																																											
Precautions	<p>◆Pattern configurations (Design of Land-patterns)</p> <p>1. When inductors are mounted on a PCB, the size of land patterns and the amount of solder used (size of fillet) can directly affect inductor performance.</p> <p>Therefore, the following items must be carefully considered in the design of solder land patterns:</p> <p>(1) The amount of solder applied can affect the ability of chips to withstand mechanical stresses which may lead to breaking or cracking. Therefore, when designing land-patterns it is necessary to consider the appropriate size and configuration of the solder pads which in turn determines the amount of solder necessary to form the fillets.</p> <p>(2) When more than one part is jointly soldered onto the same land or pad, the pad must be designed so that each component's soldering point is separated by solder-resist.</p> <p>(3) The larger size of land patterns and amount of solder, the smaller Q value after mounting on PCB. It makes higher the Q value to design land patterns smaller than terminal electrode of chips.</p> <p>◆Pattern configurations (Inductor layout on panelized[breakaway] PC boards)</p> <p>1. After inductors have been mounted on the boards, chips can be subjected to mechanical stresses in subsequent manufacturing processes (PCB cutting, board inspection, mounting of additional parts, assembly into the chassis, wave soldering the reflow soldered boards etc.)For this reason, planning pattern configurations and the position of SMD inductors should be carefully performed to minimize stress.</p>																																																																																																										
Technical considerations	<p>◆Pattern configurations (Design of Land-patterns)</p> <p>1. The following diagrams and tables show some examples of recommended patterns to prevent excessive solder amounts (larger fillets which extend above the component end terminations). Examples of improper pattern designs are also shown.</p> <p>(1) Recommended land dimensions for a typical chip inductor land patterns for PCBs</p> <div> </div> <p>Recommended land dimensions for wave-soldering (Unit:mm)</p> <table> <tr> <th>Type</th><th>1608</th><th>2012</th><th>2125</th><th>2016</th><th>2520</th><th>3216</th></tr> <tr> <td rowspan="2">Size</td><td>L</td><td>1.6</td><td>2.0</td><td>2.0</td><td>2.0</td><td>3.2</td></tr> <tr> <td>W</td><td>0.8</td><td>1.25</td><td>1.25</td><td>1.6</td><td>1.6</td></tr> <tr> <td>A</td><td>0.8~1.0</td><td>1.0~1.4</td><td>1.0~1.4</td><td>1.0~1.4</td><td>1.0~1.4</td><td>1.8~2.5</td></tr> <tr> <td>B</td><td>0.5~0.8</td><td>0.8~1.5</td><td>0.8~1.5</td><td>0.8~1.5</td><td>0.6~1.0</td><td>0.8~1.7</td></tr> <tr> <td>C</td><td>0.6~0.8</td><td>0.9~1.2</td><td>0.9~1.2</td><td>1.3~1.6</td><td>1.6~2.0</td><td>1.2~1.6</td></tr> </table> <p>Recommended land dimensions for reflow-soldering (Unit:mm)</p> <table> <tr> <th>Type</th><th>0402</th><th>0603</th><th>1005</th><th>105</th><th>1608</th><th>2012</th><th>2125</th><th>2016</th><th>2520</th><th>3216</th></tr> <tr> <td rowspan="2">Size</td><td>L</td><td>0.4</td><td>0.6</td><td>1.0</td><td>1.0</td><td>1.6</td><td>2.0</td><td>2.0</td><td>2.5</td><td>3.2</td></tr> <tr> <td>W</td><td>0.2</td><td>0.3</td><td>0.5</td><td>0.6</td><td>0.8</td><td>1.25</td><td>1.25</td><td>1.6</td><td>1.6</td></tr> <tr> <td>A</td><td>0.15~0.25</td><td>0.20~0.30</td><td>0.45~0.55</td><td>0.50~0.55</td><td>0.8~1.0</td><td>0.8~1.2</td><td>0.8~1.2</td><td>0.8~1.2</td><td>1.0~1.4</td><td>1.8~2.5</td></tr> <tr> <td>B</td><td>0.10~0.20</td><td>0.20~0.30</td><td>0.40~0.50</td><td>0.30~0.40</td><td>0.6~0.8</td><td>0.8~1.2</td><td>0.8~1.2</td><td>0.8~1.2</td><td>0.6~1.0</td><td>0.6~1.5</td></tr> <tr> <td>C</td><td>0.15~0.30</td><td>0.25~0.40</td><td>0.45~0.55</td><td>0.60~0.70</td><td>0.6~0.8</td><td>0.9~1.6</td><td>0.9~1.6</td><td>1.2~2.0</td><td>1.8~2.2</td><td>1.2~2.0</td></tr> </table>	Type	1608	2012	2125	2016	2520	3216	Size	L	1.6	2.0	2.0	2.0	3.2	W	0.8	1.25	1.25	1.6	1.6	A	0.8~1.0	1.0~1.4	1.0~1.4	1.0~1.4	1.0~1.4	1.8~2.5	B	0.5~0.8	0.8~1.5	0.8~1.5	0.8~1.5	0.6~1.0	0.8~1.7	C	0.6~0.8	0.9~1.2	0.9~1.2	1.3~1.6	1.6~2.0	1.2~1.6	Type	0402	0603	1005	105	1608	2012	2125	2016	2520	3216	Size	L	0.4	0.6	1.0	1.0	1.6	2.0	2.0	2.5	3.2	W	0.2	0.3	0.5	0.6	0.8	1.25	1.25	1.6	1.6	A	0.15~0.25	0.20~0.30	0.45~0.55	0.50~0.55	0.8~1.0	0.8~1.2	0.8~1.2	0.8~1.2	1.0~1.4	1.8~2.5	B	0.10~0.20	0.20~0.30	0.40~0.50	0.30~0.40	0.6~0.8	0.8~1.2	0.8~1.2	0.8~1.2	0.6~1.0	0.6~1.5	C	0.15~0.30	0.25~0.40	0.45~0.55	0.60~0.70	0.6~0.8	0.9~1.6	0.9~1.6	1.2~2.0	1.8~2.2	1.2~2.0

(Unit: mm)

(2) Examples of good and bad solder application

Item	Not recommended	Recommended
Mixed mounting of SMD and leaded components		
Component placement close to the chassis		
Hand-soldering of leaded components near mounted components		
Horizontal component placement		

◆Pattern configurations (Inductor layout on panelized[breakaway] PC boards)

1-1. The following are examples of good and bad inductor layout; SMD inductors should be located to minimize any possible mechanical stresses from board warp or deflection.

Item	Not recommended	Recommended
Deflection of the board		 Position the component at a right angle to the direction of the mechanical stresses that are anticipated.

1-2. To layout the inductors for the breakaway PC board, it should be noted that the amount of mechanical stresses given will vary depending on inductor layout.

An example below should be counted for better design.

1-3. When breaking PC boards along their perforations, the amount of mechanical stress on the inductors can vary according to the method used. The following methods are listed in order from least stressful to most stressful: push-back, slit, V-grooving, and perforation. Thus, any ideal SMD inductor layout must also consider the PCB splitting procedure.

3. Considerations for automatic placement

Precautions	<p>◆Adjustment of mounting machine</p> <ol style="list-style-type: none">Excessive impact load should not be imposed on the inductors when mounting onto the PC boards.The maintenance and inspection of the mounter should be conducted periodically. <p>◆Selection of Adhesives</p> <ol style="list-style-type: none">Mounting inductors with adhesives in preliminary assembly, before the soldering stage, may lead to degraded inductor characteristics unless the following factors are appropriately checked; the size of land patterns, type of adhesive, amount applied, hardening temperature and hardening period. Therefore, it is imperative to consult the manufacturer of the adhesives on proper usage and amounts of adhesive to use.																	
Technical considerations	<p>◆Adjustment of mounting machine</p> <ol style="list-style-type: none">If the lower limit of the pick-up nozzle is low, too much force may be imposed on the inductors, causing damage. To avoid this, the following points should be considered before lowering the pick-up nozzle:<ol style="list-style-type: none">The lower limit of the pick-up nozzle should be adjusted to the surface level of the PC board after correcting for deflection of the board.The pick-up pressure should be adjusted between 1 and 3N static loads.To reduce the amount of deflection of the board caused by impact of the pick-up nozzle, supporting pins or back-up pins should be used under the PC board. The following diagrams show some typical examples of good pick-up nozzle placement: <table><tr><th>Item</th><th>Improper method</th><th>Proper method</th></tr><tr><td>Single-sided mounting</td><td></td><td></td></tr><tr><td>Double-sided mounting</td><td></td><td></td></tr></table> <ol style="list-style-type: none">As the alignment pin wears out, adjustment of the nozzle height can cause chipping or cracking of the inductors because of mechanical impact on the inductors. To avoid this, the monitoring of the width between the alignment pin in the stopped position, and maintenance, inspection and replacement of the pin should be conducted periodically. <p>◆Selection of Adhesives</p> <ol style="list-style-type: none">Some adhesives may cause reduced insulation resistance. The difference between the shrinkage percentage of the adhesive and that of the inductors may result in stresses on the inductors and lead to cracking. Moreover, too little or too much adhesive applied to the board may adversely affect component placement, so the following precautions should be noted in the application of adhesives.<ol style="list-style-type: none">Required adhesive characteristics<ol style="list-style-type: none">The adhesive should be strong enough to hold parts on the board during the mounting & solder process.The adhesive should have sufficient strength at high temperatures.The adhesive should have good coating and thickness consistency.The adhesive should be used during its prescribed shelf life.The adhesive should harden rapidly.The adhesive must not be contaminated.The adhesive should have excellent insulation characteristics.The adhesive should not be toxic and have no emission of toxic gasses.When using adhesives to mount inductors on a PCB, inappropriate amounts of adhesive on the board may adversely affect component placement. Too little adhesive may cause the inductors to fall off the board during the solder process. Too much adhesive may cause defective soldering due excessive flow of adhesive on to the land or solder pad. <p>[Recommended conditions]</p> <table><tr><th>Figure</th><th>0805 case sizes as examples</th></tr><tr><td>a</td><td>0.3mm min</td></tr><tr><td>b</td><td>100~120 μm</td></tr><tr><td>c</td><td>Area with no adhesive</td></tr></table> <div><p>Amount of adhesives</p><p>After inductors are bonded</p></div>	Item	Improper method	Proper method	Single-sided mounting			Double-sided mounting			Figure	0805 case sizes as examples	a	0.3mm min	b	100~120 μm	c	Area with no adhesive

b	100~120 μm																	
c	Area with no adhesive																	

4. Soldering

Precautions	<p>◆Selection of Flux</p> <ol style="list-style-type: none"> Since flux may have a significant effect on the performance of inductors, it is necessary to verify the following conditions prior to use; <ol style="list-style-type: none"> Flux used should be with less than or equal to 0.1 wt% (Chlorine conversion method) of halogenated content. Flux having a strong acidity content should not be applied. When soldering inductors on the board, the amount of flux applied should be controlled at the optimum level. When using water-soluble flux, special care should be taken to properly clean the boards. <p>◆Soldering</p> <ol style="list-style-type: none"> Temperature, time, amount of solder, etc. are specified in accordance with the following recommended conditions, and please contact us about peak temperature when you use lead-free paste.
-------------	--

◆ Selection of Flux

- 1-1. When too much halogenated substance (Chlorine, etc.) content is used to activate the flux, or highly acidic flux is used, an excessive amount of residue after soldering may lead to corrosion of the terminal electrodes or degradation of insulation resistance on the surface of the Inductor.
- 1-2. Flux is used to increase solderability in flow soldering, but if too much is applied, a large amount of flux gas may be emitted and may detrimentally affect solderability. To minimize the amount of flux applied, it is recommended to use a flux-bubbling system.
- 1-3. Since the residue of water-soluble flux is easily dissolved by water content in the air, the residue on the surface of Inductor in high humidity conditions may cause a degradation of insulation resistance and therefore affect the reliability of the components. The cleaning methods and the capability of the machines used should also be considered carefully when selecting water-soluble flux.

◆ Soldering

1-1. Preheating when soldering

Heating: Chip inductor components should be preheated to within 100 to 130°C of the soldering. Cooling: The temperature difference between the components and cleaning process should not be greater than 100°C.

Chip inductors are susceptible to thermal shock when exposed to rapid or concentrated heating or rapid cooling. Therefore, the soldering process must be conducted with a great care so as to prevent malfunction of the components due to excessive thermal shock.

[Reflow soldering]

【Recommended conditions for eutectic soldering】

【Recommended condition for Pb-free soldering】

※Ceramic chip components should be preheated to within 100 to 130°C of the soldering.

※Assured to be reflow soldering for 2 times.

Caution

1. The ideal condition is to have solder mass (fillet) controlled to 1/2 to 1/3 of the thickness of the inductor, as shown below:

2. Because excessive dwell times can detrimentally affect solderability, soldering duration should be kept as close to recommended times as possible.

[Wave soldering]

【Recommended conditions for eutectic soldering】

【Recommended condition for Pb-free soldering】

※Ceramic chip components should be preheated to within 100 to 130°C of the soldering.

※Assured to be wave soldering for 1 time.

※Except for reflow soldering type.

Caution

1. Make sure the inductors are preheated sufficiently.
2. The temperature difference between the inductor and melted solder should not be greater than 100 to 130°C.
3. Cooling after soldering should be as gradual as possible.
4. Wave soldering must not be applied to the inductors designated as for reflow soldering only.

[Hand soldering]

【Recommended conditions for eutectic soldering】

【Recommended condition for Pb-free soldering】

(※ΔT ≤ 190°C (3216 Type max), ΔT ≤ 130°C (3225 Type min))

※It is recommended to use 20W soldering iron and the tip is 1 φ or less.

※The soldering iron should not directly touch the components.

※Assured to be soldering iron for 1 time.

Note: The above profiles are the maximum allowable soldering condition, therefore these profiles are not always recommended.

Technical
considerations

	<p>Caution</p> <ol style="list-style-type: none"> 1. Use a 20W soldering iron with a maximum tip diameter of 1.0 mm. 2. The soldering iron should not directly touch the inductor. 						
5. Cleaning							
Precautions	<p>◆Cleaning conditions</p> <ol style="list-style-type: none"> 1. When cleaning the PC board after the Inductors are all mounted, select the appropriate cleaning solution according to the type of flux used and purpose of the cleaning (e.g. to remove soldering flux or other materials from the production process.) 2. Cleaning conditions should be determined after verifying, through a test run, that the cleaning process does not affect the inductor's characteristics. 						
Technical considerations	<p>◆Cleaning conditions</p> <ol style="list-style-type: none"> 1. The use of inappropriate solutions can cause foreign substances such as flux residue to adhere to the inductor, resulting in a degradation of the inductor's electrical properties (especially insulation resistance). 2. Inappropriate cleaning conditions (insufficient or excessive cleaning) may detrimentally affect the performance of the inductors. <ol style="list-style-type: none"> (1) Excessive cleaning <ol style="list-style-type: none"> a. In the case of ultrasonic cleaning, too much power output can cause excessive vibration of the PC board which may lead to the cracking of the inductor or the soldered portion, or decrease the terminal electrodes' strength. Thus the following conditions should be carefully checked; <table> <tr> <td>Ultrasonic output</td><td>Below 20W/l</td></tr> <tr> <td>Ultrasonic frequency</td><td>Below 40kHz</td></tr> <tr> <td>Ultrasonic washing period</td><td>5 min. or less</td></tr> </table> 	Ultrasonic output	Below 20W/l	Ultrasonic frequency	Below 40kHz	Ultrasonic washing period	5 min. or less
Ultrasonic output	Below 20W/l						
Ultrasonic frequency	Below 40kHz						
Ultrasonic washing period	5 min. or less						
6. Post cleaning processes							
Precautions	<p>◆Application of resin coatings, moldings, etc. to the PCB and components.</p> <ol style="list-style-type: none"> 1. With some type of resins a decomposition gas or chemical reaction vapor may remain inside the resin during the hardening period or while left under normal storage conditions resulting in the deterioration of the inductor's performance. 2. When a resin's hardening temperature is higher than the inductor's operating temperature, the stresses generated by the excess heat may lead to inductor damage or destruction. 3. Stress caused by a resin's temperature generated expansion and contraction may damage inductors. <p>The use of such resins, molding materials etc. is not recommended.</p>						
7. Handling							
Precautions	<p>◆Breakaway PC boards (splitting along perforations)</p> <ol style="list-style-type: none"> 1. When splitting the PC board after mounting inductors and other components, care is required so as not to give any stresses of deflection or twisting to the board. 2. Board separation should not be done manually, but by using the appropriate devices. <p>◆General handling precautions</p> <ol style="list-style-type: none"> 1. Always wear static control bands to protect against ESD. 2. Keep the inductors away from all magnets and magnetic objects. 3. Use non-magnetic tweezers when handling inductors. 4. Any devices used with the inductors (soldering irons, measuring instruments) should be properly grounded. 5. Keep bare hands and metal products (i.e., metal desk) away from chip electrodes or conductive areas that lead to chip electrodes. 6. Keep inductors away from items that generate magnetic fields such as speakers or coils. <p>◆Mechanical considerations</p> <ol style="list-style-type: none"> 1. Be careful not to subject the inductors to excessive mechanical shocks. <ol style="list-style-type: none"> (1) If inductors are dropped on the floor or a hard surface they should not be used. (2) When handling the mounted boards, be careful that the mounted components do not come in contact with or bump against other boards or components. 						
8. Storage conditions							
Precautions	<p>◆Storage</p> <ol style="list-style-type: none"> 1. To maintain the solderability of terminal electrodes and to keep the packaging material in good condition, care must be taken to control temperature and humidity in the storage area. Humidity should especially be kept as low as possible. <p>Recommended conditions</p> <p>Ambient temperature Below 30°C</p> <p>Humidity Below 70% RH</p> <p>The ambient temperature must be kept below 40°C. Even under ideal storage conditions inductor electrode solderability decreases as time passes, so inductors should be used within 6 months from the time of delivery.</p> <p>*The packaging material should be kept where no chlorine or sulfur exists in the air.</p> 						
Technical considerations	<p>◆Storage</p> <ol style="list-style-type: none"> 1. If the parts are stocked in a high temperature and humidity environment, problems such as reduced solderability caused by oxidation of terminal electrodes and deterioration of taping/package materials may take place. For this reason, components should be used within 6 months from the time of delivery. If exceeding the above period, please check solderability before using the inductors.
